1. IdentraCore IAM Documentation

Welcome to the IdentraCore Identity and Access Management (IAM) documentation. This site covers configuration, administration, and troubleshooting for IdentraCore IAM 5.x.

Download PDF

1.1 What is IdentraCore IAM?

IdentraCore IAM is an enterprise identity platform that enables organizations to manage user identities, control access to applications and resources, and enforce security policies across hybrid environments.

1.2 Documentation Sections

Section	Description
Overview	Product capabilities, key concepts, and architecture
Authentication	SSO, SAML, and MFA configuration
Authorization	Role-based access control and policy management
Administration	User lifecycle and audit logging
Troubleshooting	Common errors and resolution steps

1.3 Quick Start

If you are setting up IdentraCore IAM for the first time:

1. Review the [Product Overview](#) to understand the platform.
2. Follow the [SSO Configuration](#) guide to connect your identity provider.
3. Set up [Role-Based Access Control](#) to control resource access.
4. Create your first users in [User Management](#).

version

This documentation applies to IdentraCore IAM **v5.x**. For earlier versions, contact support.

2. Overview

2.1 Product Overview

IdentraCore IAM is an enterprise-grade identity and access management platform designed for organizations managing thousands of users across cloud, on-premises, and hybrid environments.

2.1.1 Core Capabilities

- **Single Sign-On (SSO):** Users authenticate once and gain access to all connected applications.
- **Multi-Factor Authentication (MFA):** Enforce additional verification using TOTP, push notifications, or hardware tokens.
- **Role-Based Access Control (RBAC):** Assign permissions through roles rather than directly to individual users.
- **Federation:** Connect external identity providers using SAML 2.0 or OIDC.
- **Audit Logging:** Track all authentication and authorization events for compliance reporting.

2.1.2 Supported Standards

Standard	Use Case
SAML 2.0	Enterprise SSO federation
OIDC / OAuth 2.0	Modern app authentication and API authorization
SCIM 2.0	Automated user provisioning and deprovisioning
LDAP / Active Directory	On-premises directory integration

2.1.3 Deployment Options

IdentraCore IAM can be deployed in three modes:

- **SaaS:** Hosted and managed by IdentraCore. Recommended for most organizations.
- **Private Cloud:** Deployed in your cloud tenant (AWS, Azure, GCP).
- **On-Premises:** Installed on your own infrastructure for air-gapped environments.

SaaS deployment includes automatic upgrades and 99.99% uptime SLA.

2.2 Key Concepts

Understanding these terms is essential before configuring IdentraCore IAM.

2.2.1 Identity and Authentication

Identity Provider (IdP) The system that stores and verifies user identities. IdentraCore IAM can act as an IdP, or connect to an external IdP such as Active Directory, Okta, or Azure AD.

Service Provider (SP) An application that relies on the IdP to authenticate users. When a user tries to access an SP, they are redirected to the IdP for authentication.

Authentication The process of verifying that a user is who they claim to be — typically via username/password, MFA, or certificates.

Federation A trust relationship between two systems (typically an IdP and an SP) that allows users to authenticate across organizational or domain boundaries without separate credentials.

2.2.2 Authorization

Authorization The process of determining what an authenticated user is allowed to do. Authorization is separate from authentication.

Role A named collection of permissions. Users are assigned roles; roles grant access. Example: `helpdesk-agent`, `app-admin`, `read-only-auditor`.

Permission A specific action a role grants. Example: `user:read`, `group:write`, `report:export`.

Policy A rule that defines who can access what, under which conditions. Policies are evaluated at runtime during access decisions.

Least Privilege A security principle: users should have only the minimum permissions required for their job function.

2.2.3 Key Abbreviations

Abbreviation	Full Form
IAM	Identity and Access Management
SSO	Single Sign-On
MFA	Multi-Factor Authentication
RBAC	Role-Based Access Control
SAML	Security Assertion Markup Language
OIDC	OpenID Connect
SCIM	System for Cross-domain Identity Management
IdP	Identity Provider
SP	Service Provider
